### CamNtech Ltd

Upper Pendrill Court, Ermine Street North  
Papworth Everard, Cambridge, CB23 3UY, UK

Tel: +44 (0)1480 831223 Fax: +44 (0)1480 831733

Email: admin@camntech.co.uk www.camntech.com

CamNtech is the successor company to the highly successful Cambridge Neurotechnology. CNT was founded in 1995 and in 1996 introduced the Actiwatch which quickly became the actigraph of choice for sleep and activity monitoring. The Actiwatch product line was purchased by Philips Respironics in April 2008 and following this acquisition, CNT was succeeded by CamNtech.

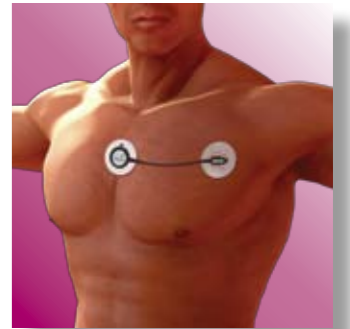

CamNtech continues CNT's excellence and innovation in engineering and product design. CamNtech's product range includes the Actiheart, the Actiwave and the PRO-Diary and full details of these products are given on the opposite page. CamNtech can also offer data analysis services to accompany all of its products. With extensive experience of electronic engineering, design and R&D, CamNtech can also assist with custom engineering projects in areas related to its products.

Based in offices just a few miles west of Cambridge, CamNtech is close to the internationally renowned university and in an area known for high technology research, development and manufacturing.

## Actiheart

The Actiheart is the first truly light-weight and waterproof self-contained logging device which allows physical activity to be recorded synchronously with heart rate. The unit is worn on the chest and is clipped onto two standard ECG pads; it is comfortable to wear for ambulatory activity and heart rate recording over a period of several days. The Actiheart has been validated against doubly labelled water and has been cited in numerous scientific publications. With a world wide user base it has become established as the gold standard in the ambulatory measurement of energy expenditure.

## Actiwave

The Actiwave range of biomedical waveform recorders are designed to capture EMG, EEG and ECG signals in daily living. Using ultra miniature recorders which are available with either 1, 2 or 4 channels of recording capability, EMG, EEG and ECG waveforms can be recorded discreetly without the need for a large belt mounted recorder or lengthy wires.

**The Actiwave Cardio** is a waterproof single channel ECG waveform recorder. It consists of two electrodes connected by a short lead which simply clip onto two standard ECG pads worn on the chest. It also contains a tri-axial accelerometer, the signal from which can be used to determine the subject's resting body position.

## PRO-Diary

The Pro-Diary (Patient Recorded Outcome diary) is a compact wrist-worn electronic diary. It can record answers to questionnaires at pre-defined times, or when the user chooses. These can be used to monitor compliance, the results of treatment, or even to remind the wearer when to take drugs and confirm that they have done so. It can also play back audio prompts to help visually impaired users.

## Bespoke Applications

CamNtech has extensive experience in electronic engineering, custom design and research & development. CamNtech can design and provide bespoke medical device solutions. Please feel free to contact CamNtech if you have any specific requirements and we would be delighted to help.
